

GeoMind

Problem:

Most of us tend to forget such simple tasks like pickup clothes from laundry, buy something from a shop, or any such things. Therefore, we need an efficient system which reminds us to complete all the work we have to do at the intended place, when we reach there.

Proposed Solution:

Developing an Android app which shows the list of tasks. This app will fetch tasks stored in the database by the user and remind the user when he/she reaches the place.

Android platform was chosen because of its large user-base and the ease to incorporate new features in the future.
